

TEMPERATURE-SENSITIVE LIPOSOMAL FORMULATION

Abstract

- 5 A liposome contains an active agent and has a gel-phase lipid bilayer membrane comprising phospholipid and a surface active agent. The phospholipids are the primary lipid source for the lipid bilayer membrane and the surface active agent is contained in the bilayer membrane in an amount sufficient to increase the percentage of active agent released at the phase transition temperature of the lipid bilayer, compared to that which would occur in the absence of the surface active agent. The
- 10 surface active agent is present in the lipid bilayer membrane so as to not destabilize the membrane in the gel phase.
